Problem Statement:

With technology today, people are more disconnected with others than ever before and meeting new people can be very challenging. There already exists many social softwares to help with this issue, like matchmaking apps and forums catered to their specific interests. The problem with these existing softwares is that their scope are too narrow. Dating softwares are solely for dating, forums are limited to their specific topics and commerce apps are strictly business. Our software will provide a stress-free environment for people to meet others for a variety of reasons reason, whether it be online dating or simply to find a friend with something in common.

Objectives:

- Allow users to connect with other users with specifics like common interests and preferences
- Develop a visually attractive and simplistic interface for users to navigate and use our application
- Develop a scalable database that can store and handle large amounts of data

Stakeholders:

- Software developers creating the project
- Moderators
- Potential user base
 - Single youths interested in online romance

- General public looking to chat with others with common ideals

Deliverables:

- An Android application that will provide an easy to use interface for participating in chats with other users
- An algorithm that will match users with one another based specific criteria such as interests
- A database to store all user information that is scalable and secure
